
Tune Image Settings

Brightness-	The brightness is exposure of the image. You can increase or decrease the light in the image by sliding right or left.
Contrast-	This is the color contrast and refers to the difference in tone throughout the image. The goal is to have a balance of contrast throughout the image. If there are any harsh shadows then adjust the contrast till the shadows are even.
Saturation-	The intensity or vibrancy of the hue or the color, to increase the intensity slide to the right. To quickly create a black and white image you can slide the saturation to "0".
Ambiance-	Controls the balance of light in throughout the image. If an image is back-lit then increasing the ambiance can create balance throughout the photo. Slide right if the subject is darker than the background. This will increase the light on the subject. To make dark images more defined and stand out, slide left to decrease the contrast. If your image is slightly flat, this feature will add flare.
Highlights-	The bright features in an image. If an image is dark you can quickly improve the image by increasing the highlights.
Shadows-	Easily can be adjusted by sliding right or left. Try to use this feature to create balanced shadows on subjects.
Warmth-	Color theory has both warm and cool tones. A cloudy sky will create an image that naturally has cool tones. This often looks unrealistic. Therefore, adjust the warmth of your shot by sliding left and right.
