

Chapter Three

HOW TO USE FILTERS

Snapseed has thirteen filters that are easy to use and can add a great touch to your image. Get creative by adding an HDR, or grunge filter. Try filters to get a fantastic image. Here is a detailed explanation on how to use Snapseed filters.

HDR Scape

The HDR Scape filter adds a high dynamic range feature to your image. HDR stands for High dynamic range. It works to create a balance between dark shadows and bright highlights creating better images. This filter brings out the shadows and enhances the details and highlights. It creates images that look full of life texture and slightly dreamy. Too much of the HDR scape filter can make the image look unreal. The controls on this filter include: filter strength, brightness, and saturation. When opening this filter the first time the filter strength is automatically set to +50 which is strong. I suggest setting the filter to about +10.

The HDR scape filter also has filter settings that can be used in different photography settings: nature, people, fine and strong. Tap on the card deck icon to see the filter options. By choosing the right filter setting for the scene you can use this Snapseed editing trick to create a HDR Scape without over editing the image.
