

Tonal Contrast

This filter is one of the best ways to alter the tones and contrast in subtle ways. You can enhance fine shadows, highlights and contrasts with more exposure control. Swipe vertically to access the editing options, then swipe left or right to adjust the image. The editing options include: high tones, mid tones, low tones, protect highlights and shadows. This is one of my favorite Snapseed editing tricks. In this filter you can easily control the changes so it enhances the image without over-editing.

High Tones-	Adjust the highlights on the image by adding more or less contrast.
Mid Tones-	Affect the middle gray tones in the image.
Low Tones-	Add more or less contrast to the shadows.
Protect Shadows-	Keeps the detail in the shadows after contrast in the low tones is adjusted.
Protect Highlights-	Keeps the detail in the highlights when the high tones are increased.
